What is the P-Shot?

The P-Shot is a cutting-edge sexual enhancement process designed to rejuvenate the penis and enhance the growth of new tissues to achieve improved erections. ***This is beneficial to men who have succumbed to prostate cancer, an enlarged prostate, post-surgical effects, and diabetes*** leading to loss of sexual function. It is a contemporary medical procedure that ***effectively assists with erectile dysfunction (ED)***, unlike other treatment methods.

The P-Shot (Priapus Shot) is a sexual rejuvenation procedure invented to bring lasting improvements to men’s sexual wellness. In the P-Shot procedure, it is your own body giving the platelet-rich plasma making it a more natural approach to treat erectile dysfunction. The P-Shot delivers results that cannot be realized by other treatment options including creams and pills.

Benefits of P-Shot

The P-Shot is indicated in erectile dysfunction and for men wanting to experience stronger, longer, and firmer erections. Its effects last for 1 year. Some of the incredible P-Shot results include:

- Increased penile blood flow and circulation
- Enhanced firmness of erection
- Increased sexual stamina
- Enhanced pleasure and sensation
- Enhanced sexual capabilities
- Increased strength and appearance where needed
- Resolved or improved discomfort from prostate
- Better straightened length and instant largeness of penis
- Corrected damages resulting from diabetes
- Restored self-confidence

The Priapus Shot for Peyronie`s Disease

Peyronie`s disease is a prevalent disease in men **caused by the formation of fibrous scar tissue inside the penis**. The plaque is the reason behind the curving of the penis which subsequently causes very painful erections. However, it should be appreciated that there are varying sizes and shapes of penises and not all men with curved penises have Peyronie`s disease.

P-Shot is a clinically proven, non-surgical Peyronie`s Disease treatment. Following P-Shot administration, the plaque gets dissolved allowing the curve to be straightened, and sexual functions are restored. This disease is very common, but there`s no need to just “live with it.”

FAQ

How Does the P-Shot Work?

The Medical experts at La Belle Vie perform the P-Shot procedure by first applying a numbing cream to the penis and drawing blood from the arm. The blood is used put into a centrifuge and is what is used to create the PRP. The shot is then given, and the local anesthetic makes it a **painless procedure that can be accomplished in 30 minutes**. The growth factors incorporated in the PRP revive existing blood vessels and stimulate the formation of new blood vessels. The aftermath is a significant enhancement of penile blood flow which is imperative for the restoration of erectile dysfunction.

How Soon Will I See Results?

The results of the P-shot in terms of erectile function can be immediate. Men who have received the injection have gone home and were better lovers that night! Noticeable P-Shot

girth gains in size could take a few weeks to notice.

Where Do I Get the Shot?

The P-shot is injected into the corpus cavernosum and into the head of the penis with a very small needle.

Am I a Good Candidate for a P-Shot?

The P-shot is recommended for men of all ages and walks of life. You are an excellent candidate for the P-Shot procedure if:

- You take ED medications such as Viagra, Levitra, or Cialis.
- You want increased sensitivity and increased girth.
- You can't take ED medications, or don't want to have to take a pill every time.
- ED medications are no longer effective.
- You have been diagnosed with Peyronie's Disease.

Are There Post-Procedure Considerations?

To achieve the best results, we provide you with a vacuum pump used to stretch the penile tissue. The action of pumping spurs the PRP and other ingredients composing the P-Shot to continue the regenerative process to optimize the length and girth of the penis.

A brief visit is highly recommended one month after your P-Shot procedure. A second P-Shot may be necessary at this time depending on the outcomes of the first shot and your providers' opinion.

How Long Does the P-Shot Last?

It is the only non-surgical method to increase penis girth, and its effects can last for a year or more, which makes the cost effective when compared to male enhancement surgery.

How Much does the P-Shot Cost?

It is the only nonsurgical alternative to increase penis size when compared to male enhancement surgery that is expensive in the long run. The P-Shot, for the most part, is considered an elective medical procedure that is not covered by most insurance companies. **The cost of the P-Shot is \$1,700.00, and that cost is inclusive of the pump** for daily use. If you opt for a **second treatment, the cost is \$ 1,200.00**.
