Sclerotherapy for Spider Veins in Utah

If you are tired of unsightly spider veins, you have **affordable options to help achieve smooth, beautiful legs**. Sclerotherapy is an innovative procedure that does not require anesthesia and you can immediately resume normal activities. **Treatments like affordable sclerotherapy and provide excellent results without risky surgery or downtime.**

Complete **recovery from sclerotherapy may take up to 8 weeks to see the full results** without swelling or bruising, but you should **begin to see fading within just a few weeks**. Depending on the number, size and the depth of your varicose veins or broken capillaries, you may need more than one treatment for optimal results.

Why Choose Sclerotherapy for Spider Veins

Sclerotherapy is used for **advanced, minimally-invasive treatment of feeder veins and spider veins**. This **safe, effective procedure uses individualized concentrations of FDA approved sclerosing solution**, depending on the size and type of vessel. Your professional trained **La Belle Vie medical aesthetician** will inject the solution directly into the targeted vein, this causes the vein to close in upon itself.

These treatments are **less painful and have no downtime** compared to surgical options. In-office **sclerotherapy is well tolerated and only takes 20-30 minutes**, on average. Post-treatment includes wearing compression stockings to help shrink the veins and decrease bruising and swelling. While you will see amazing results, **several treatments are often necessary to see an optimal reduction** of between 80-90%.

Your Free Consultation with LaBelleVie

When you make the decision to finally get rid of embarrassing spider veins, broken capillaries or bulging varicose veins – the **experienced, caring professionals at La Belle Vie** will ***determine the best treatment options available so you can be liberated from embarrassment and get back to your beautiful, confident self.*** In some cases, a combination of laser treatments and Sclerotherapy may be used.

We will ***review your medical history and conduct an exam*** of the problem areas. We will ***answer any questions you may have and talk about your expectations along with any potential risks.*** Be sure to let us know if any of the following circumstances apply to you:

- If You are Expecting

- If You've Been Diagnosed with Cancer
- If You Have a Coagulation Disorder
- Have Other Medical Conditions
- About All Prescription and OTC Medication
- If You Smoke
- If You Take Oral Contraceptives
- If You Have Any Allergies

What to Expect for Your Sclerotherapy Procedure

Do **not** apply lotion to your legs before or after **sclerotherapy**.

Your ***varicose vein or spider vein treatment plan will not require anesthesia and usually only takes a 20-30-minute visit.*** We recommend that you do not apply lotion to your legs, face or other treatment areas before or after your visit.

Sclerotherapy

For Sclerotherapy, your professional aesthetician will use a fine needle to ***slowly inject your customized solution into the targeted vein. Compression and massage are then applied*** to disperse the solution. A compression pad may be placed on the treated area if you are having more than one sclerotherapy injection during your visit.

Post-Treatment Care

After sclerotherapy, the treatment areas will be covered, and you will be required to wear compression socks. It is important that you stand up and walk around.

Moving your legs after the treatment will help prevent the formation of blood clots. Although you can resume normal activities, graduating ***compression stockings or bandages need to be worn for 1-3 weeks*** to maintain pressure on the treatment area(s).

Common Side Effects

After sclerotherapy, you can generally ***return to normal activities within a day***. As with any treatment, there may be ***common side effects***, these may include:

- Bruising
- Redness
- Swelling
- Raised red areas
- Small skin sores
- Darkened Lines or Spots
- Multiple Tiny Bed Blood Vessels

Serious complications, although rare, should be addressed immediately, these may include:

- Inflammation
- Blood Clots
- Nausea
- Headache
- Coughing
- Visual Problems
