Dermal Filler in Cheeks and Around Mouth Before and After

Say Goodbye to Wrinkles with the Right Dermal Filler from La Belle Vie

La Belle Vie offers a wide range of cosmetic injectables and fillers to help lift and smooth lines of the face. Whatever your particular needs, we can recommend the filler that's right for you.

Botox

Botox is one of the most effective treatments there is for fine lines and wrinkles. Botox treatments last anywhere from four to six months, with results appearing in a little as three days. Botox is an injectable treatment that blocks signals from the nerves to the muscles.

Typically, Botox is used to treat the forehead, crows' feet, and the '11's' between the eyebrows.

Botox can take years off the face. After treatment, you can expect to look less tired and younger. It is an easy, quick, effective procedure which provides immediate results. It takes just minutes to administer and is not painful at all—you will feel just a quick needle prick and that's all. Plus, there is no downtime with Botox; you can go about your day right after treatment.

Juvéderm®

Juvederm is another cosmetic filler that is used to restore contours of the face and help reduce the signs of aging. It is generally used on the cheeks, lips, and lines from the nose to the mouth. Today it is also used on the backs of hands to help make veins less noticeable.

The entire procedure will take anywhere from 15 to 60 minutes, and results are noticeable immediately after the procedure and will last for one to two years.

Juvederm works by adding volume to the facial tissue through its active ingredient, hyaluronic acid. Hyaluronic acid is a natural substance found in the human body. It stimulates the production of the connective tissue that plumps the skin (collagen). As you get older, the production of hyaluronic acid and collagen decreases. This increases the appearance of sagging and wrinkling of the facial skin.

During the procedure, your doctor, physician assistant, or nurse typically uses a pen to mark the areas to be treated. Your doctor will then inject Juvederm into the target area. They will also lightly massage the area to ensure an even distribution and reduce the chance of swelling. The entire procedure usually takes between 15 and 60 minutes, depending on the area treated.

Dysport

Dysport is another injectable that works to treat moderate to severe frown lines between the eyebrows. It reduces muscle activity similar to the way Botox does. One injection will be put into each of the five points between and above your eyebrows to temporarily prevent the muscle contractions that cause frown lines.

The results can be seen in just two or three days, and last up to four months. There is little to no downtime with Dysport.

Xeomin

Xeomin is a treatment for moderate to severe frown lines between the eyebrows. It is similar to Botox in that it is made from the bacteria that causes botulism and it blocks nerve activity in the muscles which will cause temporary reduction of muscle activity wherever it is injected.

It is used to treat frown lines, crow's feet, and forehead wrinkles. Results can be seen in just a few days, and last anywhere from three to four months.

Voluma

Voluma is a filler which is injected deep under the skin to provide volume, lift and contour to the cheeks, cheekbones, and jaw line. Voluma is a thick hyaluronic-based gel that will refill areas of the face that aging has deflated. Voluma offers immediate results which can last for up to two years.

Voluma is already premixed with lidocaine to help numb the area, so you won't feel any pain. The injection is done with a very fine needle, so you may feel a slight pinch when injected.

Restylane

Restylane is used to add volume and fullness to the skin. It can help correct moderate to severe facial wrinkles and folds and is often used to fill the lines from your nose to the corners of your mouth. It can also be used as a lip enhancement. It is injected into the area you'd like treated, so you may feel some discomfort when the needle is injected. Restylane will generally take effect immediately and last for six to nine months.

Radiesse

Radiesse is another injectable filler which is used to fill deep facial wrinkles or folds. Radiesse works because it improves the skin's structure from the inside. It stimulates the body's collagen production, helping add volume, strength, and flexibility to the skin. When the skin's collagen is restored, it will improve the appearance of lines and wrinkles.

Radiesse smooths lines and fills deep wrinkles around the mouth and nose. It can also smooth lines on your forehead and reduce the appearance of indented scars and other skin depressions.

The procedure takes about 30 minutes and there is no downtime. You'll see results immediately, and they will last anywhere from 9 to 15 months.

Belotero

Belotero® has a range of fillers that work to smooth and fill wrinkles and lips, restore facial volume, and even rehydrate your skin. Belotero® fillers contain lidocaine, so the process is not painful.

Once Belotero is injected, it immediately binds with the water in your skin to help fill in wrinkles and lines. You can see the results immediately, and they will last for up to six months.

Belotero is used to fill the lines from the side of the nose to the edge of the mouth, fine lines, and the hollows under the eyes.
